Epstein-Barr virus (EBV) is a member of the herpesvirus family that can infect humans. EBV infections are very common — you've probably already contracted the virus without even knowing it.

### **Epstein-Barr Virus: What to Know, From Mono to Cancer**

The Epstein-Barr virus (EBV) is a member of the herpes virus family (human herpesvirus 4). EBV is found worldwide and is a common cause of viral pharyngitis, especially in young adults. EBV is transmitted from person to person and then infects human B cells, which in turn spread the infection throughout the entire reticuloendothelial system (RES, or the liver, spleen, and peripheral lymph nodes).

Epstein-Barr virus (EBV) is a ubiquitous virus; most individuals are infected with EBV by early adulthood. Primary EBV infection is usually asymptomatic but sometimes progresses to infectious mononucleosis, which resolves spontaneously after the emergence of EBV-specific immunity [1, 2]. EBV causes chronic infections in apparently immunocompetent hosts [1, 3].
